## EXECUTIVE SUMMARY

## OVERVIEW

The purpose of this report is to evaluate the potential traffic impacts related to the proposed Masonic Care Community at the northeast corner of the intersection of Middle Road/Erie Station Road in the Town of Henrietta, NY. Within this report, the operating characteristics of the proposed access points and impacts to the adjacent roadway network are identified and mitigating measures (if needed) are provided to minimize operational concerns.

To define traffic impact, this analysis establishes existing baseline traffic conditions, projects background traffic flow including area growth, and determines the traffic operations that would result from the proposed project.

The proposed project will be at the northeast corner of the intersection of Middle Road/Erie Station Road in the Town of Henrietta, Monroe County, New York. The project site is bounded by I-90 (NYS Thruway) to the north; undeveloped lands to the east; Erie Station Road to the south; and Middle Road to the west. Land uses in the vicinity of the proposed project include residential and agriculture. The study area consists of the existing intersection of Erie Station Road/Middle Road.

The proposed project will consist of an independent living campus providing multiple living options for seniors totaling 195 units and will be supported by a customized community center offering the latest in senior living amenities and support services. Access to the proposed project will be provided via two full access driveways: one along Erie Station Road and one along Middle Road. Figure 5 illustrates the proposed site plan.

Construction of the proposed project is anticipated to reach full build-out within three years depending on market conditions. Town of Henrietta personnel were contacted to discuss any other specific projects that are currently approved or under construction that would generate additional traffic in the study area. The proposed Erie Station Road Distribution Facility Traffic Study, prepared by Passero Associates, identified four background projects as part of its analysis. Traffic volumes generated by the background projects identified in that study, as well as the traffic generated from the proposed Erie Station Road Distribution Facility were added to the study intersection. The four remaining projects were:

- 4799 West Henrietta Road Development
- Lehigh Station Road and East River Road Development
- Riverton Parcel "E"
- Howlett Acres Subdivision

To account for normal increases in background traffic growth, including any unforeseen developments in the project study area aside from those identified, a growth rate of $1.0 \%$ per year was applied to the existing traffic volumes in the study area. This growth rate was determined using the recommended annual growth rate for the Town of Henrietta, as determined by the Monroe County Department of Transportation in a study of traffic trends along county roadways.

## CONCLUSIONS \& RECOMMENDATIONS

This Traffic Impact Study identified and evaluated the potential traffic impacts that can be expected from the proposed Masonic Care Community project in the Town of Henrietta, New York. The results of this study determined that the existing transportation network can
adequately accommodate the projected traffic volumes and resulting minor impacts to study area intersections. The following sets forth the conclusions and recommendations based upon the results of the analyses:

1. Using ITE Trip Generation Manual, the proposed project is expected to generate approximately 21 entering/43 exiting vehicle trips during the AM peak hour and 46 entering/29 exiting vehicle trips during the PM peak hour.
2. The sight distance evaluation performed at both proposed driveway locations resulted in sufficient required Stopping Sight Distances and desirable Intersection Sight Distances.
3. The warrants for a left-turn treatment at both proposed driveway locations were not satisfied during either peak hour studied.
4. The projected minor traffic impacts resulting from full development of the proposed project during both peak hours can be accommodated by the existing transportation network and study area intersections. No capacity improvements are required.

## I. INTRODUCTION

The purpose of this report is to evaluate the potential traffic impacts related to the proposed Masonic Care Community at the northeast corner of the intersection of Middle Road/Erie Station Road in the Town of Henrietta, NY. Within this report, the operating characteristics of the proposed access points and impacts to the adjacent roadway network are identified and mitigating measures (if needed) are provided to minimize operational concerns.

To define traffic impact, this analysis establishes existing baseline traffic conditions, projects background traffic flow including area growth, and determines the traffic operations that would result from the proposed project.

## II. LOCATION

The proposed project will be at the northeast corner of the intersection of Middle Road/Erie Station Road in the Town of Henrietta, Monroe County, New York. The project site is bounded by I-90 (NYS Thruway) to the north; undeveloped lands to the east; Erie Station Road to the south; and Middle Road to the west. Land uses in the vicinity of the proposed project include residential and agriculture. The study area consists of the existing intersection of Erie Station Road/Middle Road.

The project site location and study area are illustrated in Figure 1 (all figures are included at the end of this report).

## III. EXISTING HIGHWAY SYSTEM

## A. Vehicular Network Description

The following information outlined in Table I provides a description of the existing roadway network within the study area. Figure 2 illustrates the lane geometry at each of the study intersections and the Annual Average Daily Traffic (AADT) volumes on the study roadways. The AADTs reflect the most recently collected data obtained from the New York State Department of Transportation (NYSDOT).

Functional classification of highways within the study area is determined by the NYSDOT and the Federal Highway Administration (FHWA). Definitions of the functional classifications shown in Table I are provided after the table.

TABLE I: EXISTING HIGHWAY SYSTEM

| ROADWAY | CLASS $^{1}$ | AGENCY $^{2}$ | SPEED <br> LIMIT $^{3}$ | TRAVEL <br> LANES $^{4}$ | TRAVEL <br> PATTERN/ <br> DIRECTION |  <br> SOURCE $^{5}$ |
| :--- | :---: | :---: | :---: | :---: | ---: | ---: | ---: |
| Erie Station Road <br> (CR-71) | 16 | MCDOT | 35 | 2 | Two-way/ <br> East-West | NYSDOT (2019) |

## Notes:

1. State Functional Classification of Roadway.
2. Jurisdictional Agency of Roadway.
3. Posted or Statewide Limit in Miles per Hour (mph).
4. Number of travel lanes. Excludes turning/auxiliary lanes developed at intersections.
5. Estimated AADT in Vehicles per Day (vpd). AADT Source (Year).

## Urban Minor Arterial (Class 16)

An urban minor arterial provide service for trips of moderate length, serve geographic areas that are smaller than higher arterial roadways, and offer connectivity to higher arterial systems. These roadways distribute traffic to smaller geographic areas, provide more land access without disrupting neighborhood access, and provide urban connections for rural collectors.

## Urban Major Collector (Class 17)

The collector street system provides both land access service and traffic circulation in higher density residential neighborhoods and commercial and industrial areas. The collector street distributes trips from the arterials through the area to their ultimate destination and vice versa (i.e., the collector street also collects traffic from local streets in residential neighborhoods and channels it into the arterial system). The collector street system may also service bus routes. Operating characteristics tend to include higher speeds and more signalized intersections.

## B. Multi-Modal Network Description

This evaluation reviewed the study area's pedestrian, bicycle, and transit network via field and aerial reconnaissance. A description of the multi-modal infrastructure is described hereafter.

## Pedestrian \& Bicycle Facilities

There are no sidewalk facilities within the study area.
There are no dedicated bicycle lanes or trails, although cyclists are permitted to share the road with motorists on all roadways within the study area.

## Transit Facilities

Regional Transit Service (RTS) provides regional bus service. No service is provided in the study area.

## IV. EXISTING TRAFFIC CONDITIONS

## A. Peak Intervals for Analysis

Given the functional characteristics of the study corridors, adjacent land uses, and the proposed land use for the project site (retirement community), the peak hours selected for analysis are the weekday commuter AM and PM peak periods. The combination of site traffic and adjacent through traffic produces the greatest demand during these time periods.

## B. Existing Traffic Volume Data

Turning movement traffic counts were collected by SRF at the Erie Station Road/Middle Road intersection on Thursday, January 13, 2022. Traffic counts were conducted from 7:00-9:00 AM and 4:00-6:00 PM. The peak hour traffic periods generally occurred from 7:00-8:00 AM and 4:15-5:15 PM. The unadjusted weekday AM and PM peak hour volumes are reflected in Figure 3A.

It is noted, however, that traffic volumes may be impacted by the COVID-19 pandemic. The NYSDOT released a study in February 2021 that described the effect the COVID-19 pandemic had on traffic in New York State in 2020. The NYSDOT study illustrated the percent difference 2020 weekday ADTs to average weekday ADTs prior to 2020. Additionally, traffic volumes were compared to traffic data obtained in various locations in the study area before the COVID-19 pandemic by the NYSDOT. Both the NYSDOT study and historic counts in the study area were used to adjust the collected data to reflect 2022 representative traffic conditions by increasing the collected traffic volumes. This is consistent with NYSDOT and ITE methodology for adjustments related to collected traffic volumes affected by the COVID-19 pandemic. Seasonal variations were also considered as part of this review.

Figure 3B illustrates the representative 2022 weekday AM and PM peak hour base volumes used for analysis purposes in this study.

## V. FUTURE AREA DEVELOPMENT AND LOCAL GROWTH

Construction of the proposed project is anticipated to reach full build-out within three years depending on market conditions. Town of Henrietta personnel were contacted to discuss any other specific projects that are currently approved or under construction that would generate additional traffic in the study area. The proposed Erie Station Road Distribution Facility Traffic Study, prepared by Passero Associates, identified four background projects as part of its analysis. Traffic volumes generated by the background projects identified in that study, as well as the traffic generated from the proposed Erie Station Road Distribution Facility were added to the study intersection. The four remaining projects were:

- 4799 West Henrietta Road Development
- Lehigh Station Road and East River Road Development
- Riverton Parcel "E"
- Howlett Acres Subdivision

To account for normal increases in background traffic growth, including any unforeseen developments in the project study area aside from those identified, a growth rate of $1.0 \%$ per year was applied to the existing traffic volumes in the study area. This growth rate was determined using the recommended annual growth rate for the Town of Henrietta, as
determined by the MCDOT in a study of traffic trends along county roadways. All ambient growth materials are included in the Appendices. The background traffic volumes are depicted in Figure 4.

## VI. PROPOSED DEVELOPMENT

## A. Project Description

The proposed project will consist of an independent living campus providing multiple living options for seniors totaling 195 units and will be supported by a customized community center offering the latest in senior living amenities and support services. Access to the proposed project will be provided via two full access driveways: one along Erie Station Road and one along Middle Road. Figure 5 illustrates the proposed site plan.

## B. Site Generated Traffic

The volume of traffic generated by a site is dependent on the intended land use and size of the development. Trip generation is an estimate of the number of trips generated by a specific building or land use. These trips represent the volume of traffic entering and exiting the development. Trip Generation Manual (11 th Edition) published by the Institute of Transportation Engineers (ITE) is used as a reference for this information. The trip rate for the peak hour of the generator may or may not coincide in time or volume with the trip rate for the peak hour of adjacent street traffic. Volumes generated during the peak hour of the adjacent street traffic and proposed land use, in this case, the weekday commuter AM and PM peaks, represent a more critical volume when analyzing the capacity of the system; those intervals will provide the basis of this analysis.

Table II shows the total site generated trips for full development of the project. All trip generation information has been included in the Appendices.

TABLE II: SITE GENERATED TRIPS

| DESCRIPTION | ITE LUC | SIZE | AM PEAK HOUR |  | PM PEAK HOUR |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | ENTER | EXIT | ENTER | EXIT |
| Senior Adult Housing | 251 | 195 units | 21 | 43 | 46 | 29 |

Using ITE Trip Generation Manual, the proposed project is expected to generate approximately 21 entering/43 exiting vehicle trips during the AM peak hour and 46 entering/29 exiting vehicle trips during the PM peak hour.

## C. Site Traffic Distribution

The cumulative effect of site-generated traffic on the transportation network is dependent on the origins and destinations of that traffic and the location of the access drives serving the site. The proposed arrival/departure distribution of traffic generated by the proposed project is considered a function of several parameters, including:

- Population centers using Census Data
- Commercial centers
- Proposed access locations
- Access to I-90 and I-390
- Existing traffic patterns
- Existing traffic conditions and controls

Figure 6 shows the anticipated trip distribution pattern percentages for the traffic from the project site. Figure 7 illustrates the peak hour project site-generated traffic based on those percentages.

## VII. FULL DEVELOPMENT VOLUMES

Proposed design hour traffic volumes are developed for the AM and PM peak hours by combining the background traffic conditions (Figure 4) and the new site generated traffic volumes (Figure 7) to yield the traffic volumes under full development conditions. The resulting design hour volumes for the proposed project are illustrated in Figure 8 under full build-out conditions.

## VIII. CAPACITY ANALYSIS

## A. Description of Capacity Analysis

Capacity analysis is a technique used for determining a measure of effectiveness for a section of roadway and/or intersection based on the number of vehicles during a specific time period. The measure of effectiveness used for the capacity analysis is referred to as a Level of Service (LOS). Levels of Service are calculated to provide an indication of the amount of delay that a motorist experiences while traveling along a roadway or through an intersection. Since the most amount of delay to motorists usually occurs at intersections, capacity analysis focuses on intersections, as opposed to highway segments.

Six Levels of Service are defined for analysis purposes. They are assigned letter designations, from "A" to "F", with LOS "A" representing the conditions with little to no delay, and LOS "F" conditions with very long delays. Suggested ranges of service capacity and an explanation of Levels of Service are included in the Appendices. LOS "C" or better is generally desirable, but LOS "D" for signalized locations and LOS "E" for unsignalized are generally acceptable during peak periods so long as the volume to capacity ratio $(\mathrm{v} / \mathrm{c})$ is below 1.0.

The standard procedure for capacity analysis of signalized and unsignalized intersections is outlined in the Highway Capacity Manual (HCM 2016) published by the Transportation Research Board (TRB). Traffic analysis software, Synchro 11, which is based on procedures and methodologies contained in the HCM, was used to analyze operating conditions at study area intersections. The procedure yields a Level of Service based on the HCM as an indicator of how well intersections operate.

## B. Capacity Analysis Results

Existing and background operating conditions during the peak study periods are evaluated to determine a basis for comparison with the projected future conditions. The future traffic conditions generated by the proposed project were analyzed to assess the operation of the study area intersections. Capacity results for existing, background, and full development conditions are listed in Table III. The discussion following the table summarizes capacity conditions.

| INTERSECTION | $\begin{gathered} 2022 \\ \text { EXISTING BASE } \\ \text { CONDITIONS } \end{gathered}$ |  |  |  | $\begin{gathered} 2024 \\ \text { BACKGROUND } \\ \text { CONDITIONS } \end{gathered}$ |  |  |  | $2024$ <br> FULL BUILD CONDITIONS |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | AM |  | PM |  | AM |  | PM |  | AM |  | PM |  |
| 1. MIDDLE ROAD/PROPOSED DRIVEWAY |  |  |  |  |  |  |  |  |  |  |  |  |

| EB - Erie Station Road | A | 9.6 |  |  | B | 10.3 | B | 10.1 | B | 11.2 | B | 10.3 | B | 11.5 |
| WB - Erie Station Road | A | 8.6 | A | 9.4 | A | 9.1 | B | 10.1 | A | 9.2 | B | 10.3 |
| NB - Middle Road | A | 9.0 | A | 8.8 | A | 9.5 | A | 9.3 | A | 9.6 | A | 9.4 |
| SB - Middle Road | A | 8.1 | B | 10.5 | A | 8.5 | B | 11.9 | A | 8.5 | B | 12.2 |

Notes:

1. A (0.0) = Level of Service (Delay in seconds per vehicle)
2. $\mathrm{EB}=$ Eastbound, $\mathrm{WB}=$ Westbound, $\mathrm{NB}=$ Northbound, $\mathrm{SB}=$ Southbound
3. N/A = Approach does not exist and/or was not analyzed during this condition

## 1. Middle Road/Proposed Driveway

All movements are projected to operate at LOS " B " or better under full build conditions during both peak hours studied. No capacity improvements are warranted nor recommended. The driveway shall be stop-controlled on the westbound exiting approach from the project site.

## 2. Erie Station Road/Proposed Driveway

All movements are projected to operate at LOS " B " or better under full build conditions during both peak hours studied. No capacity improvements are warranted nor recommended. The driveway shall be stop-controlled on the southbound exiting approach from the project site.

## 3. Erie Station Road/Middle Road

All movements operate at LOS " B " or better under existing and projected background conditions. No changes in LOS are projected between background and full build conditions. Therefore, no capacity improvements are recommended based on the minor traffic impacts associated with the proposed project.

## IX. SIGHT DISTANCE EVALUATION

Sight distance was investigated at the proposed driveways along Erie Station Road and Middle Road. Sight distance is provided at intersections to allow drivers to perceive the presence of potentially conflicting vehicles. This should occur in sufficient time for a motorist to stop or adjust their speed, as appropriate, to avoid a collision at the intersection. Sight distance is also provided at intersections to allow the drivers of stopped vehicles a sufficient view of the intersecting highway to anticipate and avoid potential incidents. If the available sight distance for an entering or crossing vehicle is at least equal to the appropriate Stopping Sight Distance (SSD) for the major road, then drivers have sufficient sight distance to anticipate and avoid collisions. To enhance traffic operations, Intersection Sight Distances (ISD) that exceed SSD are desirable along the major road.

A Policy on Geometric Design of Highways and Streets published by the American Association of State Highway and Transportation Officials (AASHTO) in 2011 was used as a reference to establish the required SSD and desirable ISD.

The required SSD and desirable ISD for a left turn from a stop are based on the design speed (posted plus 5 MPH) for a given section of roadway. Table IV depicts the results.

TABLE IV: SIGHT DISTANCE REQUIREMENT AND MEASUREMENTS

| INTERSECTION | POSTED <br> SPEED | DESIGN SPEED | $\begin{aligned} & \text { REQUIRED } \\ & \text { SSD } \end{aligned}$ | $\begin{gathered} \text { DESIRABLE } \\ \text { ISD } \end{gathered}$ | AVAILABLE SIGHT DISTANCE TO THE: |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | LEFT | RIGHT |
| Erie Station Road/ Proposed Driveway | 35 mph | 40 mph | 305' | 445' | $\begin{aligned} & \text { ISD: >500' } \\ & \text { SSD: >500' } \end{aligned}$ | $\begin{aligned} & \text { ISD: >500' } \\ & \text { SSD: >500' } \end{aligned}$ |
| Middle Road/ Proposed Driveway | 45 mph | 50 mph | 425' | 555' | $\begin{aligned} & \text { ISD: >600' } \\ & \text { SSD: >600' } \end{aligned}$ | $\begin{aligned} & \text { ISD: >600' } \\ & \text { SSD: >600' } \end{aligned}$ |

The available sight distances exceed the required SSD and desirable ISD. No mitigation is required. Any brush and foliage along the sight lines should be maintained to ensure maximum visibility at the site access locations.

## X. LEFT TURN TREATMENT WARRANT INVESTIGATION

Volume warrants for left turn treatments along Middle Road and Erie Station Road at proposed driveways were investigated using NCHRP Report 279: Intersection Channelization Design Guide (1985) published by the Transportation Research Board (TRB). Provisions for left turn lane facilities should be established where traffic volumes are high enough and safety considerations are sufficient to warrant the additional lane. This investigation analyzes warrants during the peak hours of study. All supporting calculations are included in the Appendices.

The warrants are based, in part, on the design speed for a given section of roadway (e.g., posted speed plus 5 MPH).

When consider the combination of traffic volumes and the design speed for the given roadways, the warrants for a left-turn treatment are not satisfied at the proposed driveways. Thus, no treatment is recommended.

## XI. CONCLUSIONS \& RECOMMENDATIONS

This Traffic Impact Study identified and evaluated the potential traffic impacts that can be expected from the proposed Masonic Care Community project in the Town of Henrietta, New York. The results of this study determined that the existing transportation network can adequately accommodate the projected traffic volumes and resulting minor impacts to study area intersections. The following sets forth the conclusions and recommendations based upon the results of the analyses:

1. Using ITE Trip Generation Manual, the proposed project is expected to generate approximately 21 entering/43 exiting vehicle trips during the AM peak hour and 46 entering/29 exiting vehicle trips during the PM peak hour.
2. The sight distance evaluation performed at both proposed driveway locations resulted in sufficient required Stopping Sight Distances and desirable Intersection Sight Distances.
3. The warrants for a left-turn treatment at both proposed driveway locations were not satisfied during either peak hour studied.
4. The projected minor traffic impacts resulting from full development of the proposed project during both peak hours can be accommodated by the existing transportation network and study area intersections. No capacity improvements are required.

| County |  |  |  |
| Only | 1.2 | 0.8 | 1.0 |
| City+County | 0.2 | 0.3 | 0.5 |

* Judgment is needed when selecting an annual growth rate for City streets within the City of Rochester. Instead of using a uniform $0.5 \%$ per year rate throughout the City, the growth rate of the nearest adjacent suburb may be more appropriate. For areas on the west side. Gates' $2.5 \%$ per year may be too high. We do recommend $1.5 \%$ per year growth around the University of Rochester area. For areas on the northeast side, Irondequoit's $1.0 \%$ per year may be appropriate. $1.0 \%$ per year is suitable for the other areas within the City, including the CBD.

The recommended annual growth rates shown in Table 1 are appropriate for projecting future traffic volumes on County roads and City streets when more specific growth data is not available. As noted in the discussion above, they should be applied as straight annual growth rates and not compounded.

## Land Use: 251 <br> Senior Adult Housing-Single-Family

## Description

Senior adult housing-single-family sites are independent living developments that are called various names including retirement communities, age-restricted housing, and active adult communities. The development has a specific age restriction for its residents, typically a minimum of 55 years of age for at least one resident of the household.

Residents in these communities are typically considered active and requiring little to no medical supervision. The percentage of retired residents varies by development. The development may include amenities such as a golf course, swimming pool, 24-hour security, transportation, and common recreational facilities. They generally lack centralized dining and on-site health facilities.

The dwelling units can be either detached or attached. The types of housing types represented by sites in the database include traditional single-family detached homes, patio homes, duplexes, and townhouses. Single-family attached housing includes any single-family housing unit that shares a wall with an adjoining dwelling unit, whether the walls are for living space, a vehicle garage, or storage space.

Senior adult housing-multifamily (Land Use 252), congregate care facility (Land Use 253), assisted living (Land Use 254), and continuing care retirement community (Land Use 255) are related land uses.

## Additional Data

Caution should be used when applying trip rates for this land use as it may contain a wide variety of studies ranging from communities with very active, working residents to communities with older, retired residents. As more data become available, consideration will be given to future stratification of this land use.

Many factors affected the trip rates for detached senior adult housing. Factors such as the average age of residents, development location and size, affluence of residents, employment status, and vehicular access should be taken into consideration when conducting an analysis. Some developments were located within close proximity to medical facilities, restaurants, shopping centers, banks, and recreational activities.

The technical appendices provide supporting information on time-of-day distributions for this land use. The appendices can be accessed through either the ITETripGen web app or the trip generation resource page on the ITE website (https://www.ite.org/technical-resources/topics/trip-and-parking-generation/).

For the six sites for which data were provided for both occupied dwelling units and total dwelling units, an average of 98 percent of the units were occupied.

The sites were surveyed in the 1980s, the 1990s, the 2000s, and the 2010s in Alberta (CAN), California, Delaware, Florida, Maryland, New Jersey, New York, Pennsylvania, Virginia, and Washington.

## A3

## Level of Service: Criteria and Definitions

## Level of Service Criteria

## Highway Capacity Manual 2016

## SIGNALIZED INTERSECTIONS

Level of Service is a qualitative measure describing operational conditions within a traffic stream, based on service measures such as speed and travel time, freedom to maneuver, traffic interruptions, comfort, and convenience. Level of Service for signalized intersections is defined in terms of delay specifically, average total delay per vehicle for a 15-minute analysis period. The ranges are as follows:

| Level of <br> Service | Control Delay per vehicle <br> (seconds) |
| :---: | :---: |
| A | $<10$ |
| B | $10-20$ |
| C | $20-35$ |
| D | $35-55$ |
| E | $55-80$ |
| F | $>80$ |

## UNSIGNALIZED INTERSECTIONS

Level of Service for unsignalized intersections is also defined in terms of delay. However, the delay criteria are different from a signalized intersection. The primary reason for this is driver expectation that a signalized intersection is designed to carry higher volumes than an unsignalized intersection. The total delay threshold for any given Level of Service is less for an unsignalized intersection than for a signalized intersection. The ranges are as follows:

| Level of <br> Service | Control Delay per vehicle <br> (seconds) |
| :---: | :---: |
| A | $<10$ |
| B | $10-15$ |
| C | $15-25$ |
| D | $25-35$ |
| E | $35-50$ |
| F | $>50$ |
